Executive Summary
Template

Price is not the main churn driver — shift focus to profitability and usage signals

- Net margin and 12-month usage predict churn far better than price does

PowerCo loses ~10% of customers every 3 months; price is the suspected cause

- Assumed driver: customers switching to lower-cost competitors as prices rise

Price doesn’t hold up as the main driver, and the model misses many churners

- Price features rank low in importance; the model's false-negative rate is still high

If not price, what is driving churn — and can the model be trusted to act on?

- Next: refine margin/usage features, tune the model, then re-test price’s role
